

New GUI debugger prototype

Changes made from the previous implementation

- Accumulator and Program Counter are now accessible on-screen and editable, meaning we no longer have need of the s command button and the aa command button. We need to implement the next instruction part of s.
- The main-centered display area will show the contents of memory such that we no longer have need of the amb command/button

Changes to make

- Run, Pause and Stop will no longer be icons but text
- Remove the mb button as aspects of gui are capable of handling it's functionality
